

BASIC INIEZIONE

Injection mix with natural hydraulic lime for the consolidation of rubble-filled walls

Scheda Tecnica rev 01 05/2025

DESCRIPTION

Basic INIEZIONE is an injection mixture with high resistance to sulphates and a low content of water-soluble salts based on NHL natural hydraulic lime, specially formulated to regenerate and consolidate, through injection, masonry and cavity foundations in brick or cut stone.

Basic INIEZIONE has a low content of water-soluble salts and is physically and chemically compatible with the original components of the masonry, with similar mechanical characteristics; it can be injected with any pump into cracks or cavities with proper injectors.

USES

Basic INIEZIONE is used for the restoration and preconsolidation of ancient brick or flint walls by means of injecting with low pressure injection systems.

WORKS

Repair of ancient masonry rubble-filled walls through injection of mixture with high mechanical strength and low content of water-soluble salts (SA51)

CERTIFICATIONS

It is CE marked according to the UNI EN 998-2 for mortar for masonry class M15.

WORKS

Repair of ancient masonry rubble-filled walls through injection of mixture with high mechanical strength and low content of water-soluble salts (sa51)

APPLICATION

Basic INIEZIONE must be mixed with water in the quantity shown in the table.

Add 3/4 of water required into the mixer, then add the product and the remaining water continuously until you obtain the consistency required.

No component other than the mixing water must be added to the product during preparation and laying.

Basic INIEZIONE must be injected into walls by means of normal electric or manual low-pressure pumps, using injectors fixed into the holes and proceeding from the lower holes towards the upper ones.

Do not remix by adding water to the product when it has already started to set. With frescoed walls, use Limepor IZ8 and contact our Technical Department for support.

CONSUMPTION

1,5 Kg/dmc

Absorption per cubic metre of masonry: about 80-190 kg depending on the size of the cavities in the wall.

PACKAGING

Bag 25 Kg.

STORAGE

Protect from humidity. Store in a dry, sheltered place. In these conditions the product remains stable for 12 months.

WARNING

Product for professional use.

The use of natural raw materials may result in natural color

variations from different production batches.

Before using, check bags have not been damaged, and do not use the product if there are any lumps.

For further information and advice on safe handling, storage and disposal of chemical products, the user must refer to the most recent Safety Data Sheet, containing physical, ecological, toxicological and other data related to safety.

All technical data shown in this Technical Data Sheet are based on laboratory tests. Actual measurement data may vary due to circumstances beyond our control.

The information and requirements indicated in this Technical Data Sheet are based on our current knowledge and experience and are to be considered, in any case, purely indicative. They cannot guarantee the final result of the applied product and they have to be confirmed by exhaustive practical applications; therefore the user must test the suitability of the product for the intended application and its purpose. Users must always refer to the latest version of the local technical data sheet related to the product.

TECHNICAL SPECIFICATIONS

SK51 – Repair of ancient masonry rubble-filled walls through injection of mixture with high mechanical strength and low content of water-soluble salts

Repair of ancient rubble-filled walls (also frescoed) by injecting a mixture with zero water-soluble salts after grouting all the cracks (if the masonry is plastered, check that the plaster adheres perfectly to the support); hole preparation (4 to sq.m, with a diameter of 20-24 mm), positioning and sealing injectors; masonry washing; injection with normal manual or electrical equipment, until the masonry is completely saturated, with Basic INIEZIONE grout by Kimia S.p.A. or similar product. The masonry can be considered saturated when the mortar leaves the injector immediately above the injection one. Material consumption will be at least 150 Kg/mc. After the injection work, removing all the injectors, filling the holes and preparing the masonry for future interventions.

The injection product, consisting of NHL natural hydraulic lime, characterized by a low content of water-soluble salts and by physical, chemical and mechanical compatibility with the components used in ancient times in masonry, will be prepared and applied scrupulously following the instructions on the technical data sheets provided by the manufacturer and will have the following characteristics:

- Grain size distribution EN 1015-1 (passing 0.09mm): 100%;
- Grain size distribution EN 1015-1 (passing

- 0.06mm): 90%;
- Compressive strength after 7 days EN 1015-11:> 10 MPa;
- Compressive strength after 14 days EN 1015-11:> 15 MPa;
- Compressive strength after 28 days EN 1015-12:> 18 N / mm²;
- Compressive strength after 90 days EN 1015-12:> 20 N / mm²;
- 7 days flexural strength EN 1015-11:> 3.6 MPa;
- Flexural strength after 14 days EN 1015-11:> 3.9
 MPa:
- Flexural strength after 28 days EN 1015-11:> 4.9 Mpa.

The manufacturer will be able to show its know-how in the production of injection products (providing reports of experimental tests already carried out on site, also of a comparative nature).

The basic binder of the product will be CE marked on the basis of EN 459 009/CPD/A46/0003; the product will be CE marked as a mortar with the prescribed composition according to EN 998-2.
