

Cleaning of stone materials affected by microflora and molds

LV19_SA_EN_R2-0617

APPLICATION DATA SHEET

Cleaning of stone materials affected by microflora and molds:

1. preparation of the substrate;
2. cleaning.

1) PREPARATION OF THE SUBSTRATE

Detached or semi-detached parts have to be removed or consolidated using proper techniques.

If necessary, perform a mechanical cleaning of the surface by micro-sandblasting, adjusting the pressure and the amplitude of the jet, using as aggregate silica sand powder or simply compressed air.

2) CLEANING

If there are microflora and molds, clean the surface with **Kimistone BIOCIDA**, applying the product by brush or low pressure spray, respecting the consumption rate indicated in the Technical Data Sheet, and brushing it vigorously with a broom or nylon brush. Finally rinse with abundant quantity of water.
